Motivation: Energy Efficiency Paradox

- Consumers and businesses tend to underinvest in energy efficiency even with seemingly high returns,
 - "Energy efficiency paradox" (Jaffe & Stavins, 1994)
- Present value of cost savings equals extra upfront cost only with high implicit discount rates

Estimated Implicit Discount Rates of Durable Goods

Fig. 1. Estimates of average discount rates.

Motivation: Possible Explanations of High Implicit Discount Rates

- External barriers
 - Credit constraints
 - Lack of information
 - Imperfect competition
 - Different incentives (e.g. landlord vs. tenant)
- Behavioral error
 - Bounded rationality
- Estimates may be confounded by unobservable characteristics

Consequences of Energy Efficiency Paradox

Current Policy Motivation

Improving energy efficiency standards

- Political constraints prevent favored tools (pigouvian tax or cap and trade)
- Big push on energy standards by Obama administration
 - Efficiency standards of cars, trucks and home appliances
- Arguments on energy efficiency paradox remain
 - A case of market failures
 - Does energy efficiency paradox exist and does it matter?

Why Do We Revisit Energy Efficiency Paradox?

Previous literature has some limitations

- Previous literature does not meet modern standards of credibility (Allcott and Greenstone[2012])
 - Cross-sectional
 - Unobservable characteristics
 - Omitted variable biases
- Evidence is somewhat outdated
 - Time period: 1980s and 1990s
 - Updated energy efficiency standards
 - Different electricity prices and interest rates

Motivation: Trend of Recent Studies

- Employ panel data
 - Allcott & Wozny (2012), Sallee et. al (2009), and Busse et al. (2013)
 - Address omitted variable biases by using fixed effects
- Use time series variations in interest rates and energy prices

Contributions

- Focus on appliance market
- Using the fact that interest rate and electricity price changes differentially affect appliances depending on energy efficiency status
- Panel study design
 - First time in appliance market to study energy efficiency paradox
- Big and recent micro-level data set (i.e individual appliance model)

Identification Strategy of Empirical Study

- Using relative PVOC changes, purely driven by fluctuations of interest rates and electricity prices, of more versus less energy efficient products.
- Estimate how the relative price changes are associated with the relative PVOC changes depending on energy efficiency status.

With increasing PVOC gap of more vs. less energy efficient appliances,

- relative sales of energy efficient products increase.
- relative prices of more vs. less energy efficient appliances down, not up.

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Possible Explanations of the Results?

- Increasing returns to scale
- Technological Improvements

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ○臣 - の々ぐ

Possible Explanations of the Results?

 More elastic demand curve of energy efficient appliances with rising energy costs

▲□▶ ▲圖▶ ★ 国▶ ★ 国▶ - 国 - のへで

Conclusion

- Consumers tend to respond to benefits from using energy efficient products
- Persistence of large energy efficiency gap
- Increasing economies scale and imperfect competition likely complicate the analysis of energy efficiency and standards
